

CCDC Inject

INJECT NAME	Design Network Isolation Requirement
INJECT ID	DSGN07T

INJECT DESCRIPTION:

The CISO is concerned about inter-segment network traffic within our internal network. There are some potential future applications that will require some measure of isolation. The potential of a machine becoming compromised on one of our segments and mounting an attack on machines on other segments needs to be addressed.

Identify the capabilities in our existing infrastructure that will allow us to limit inter-segment packet flows to only those that are expected and log those that are not expected. We can then use those logs, of unexpected packets, to identify potential malware or otherwise compromised machines. Implement this solution.

INJECT DELIVERABLE

Respond with a business memo that describes how we might configure our existing infrastructure to meet this goal with evidence for its implementation.
